

## AMENDMENTS IN THE CLAIMS

- Sub. B' > a1
1. (Currently amended) A device for the fixation of dimensionally stable suitcases in a cargo space of a motor vehicle, wherein, in a cargo space floor (3), receiving tracks (4) are provided, which are associated with securing means (5) for the suitcases (6), wherein corresponding securing elements (10), which can be engaged with positive lock with the securing means (5) in the cargo space, are provided on the suitcases (6), and wherein actuation means (7, 8, 9) are provided for the manual separation of the securing means (5) and the securing elements (10) from each other, and arranged in the cargo space or on the suitcase, wherein the receiving tracks are integrally mounted within the cargo space floor, such that upper surfaces of the receiving tracks are of a level height with surrounding areas of the cargo space floor and are not elevated with respect to same.
  2. (Cancelled).
  3. (Original) The device according to Claim 1, wherein the securing elements (10) are positioned on the bottom side of each suitcase.
  4. (Cancelled).
  5. (Original) The device according to Claim 1, wherein the actuation means present a manually operated rotating element (7), which, via a transfer mechanism (8), moves the securing elements (10) or the securing means to the open or the stopped position.
  6. (New) A dimensionally stable suitcase (6) for use in a vehicle, having a cargo space floor (3) into which receiving tracks (4) have been provided, the receiving tracks (4) having securing means (5) disposed therein, the dimensionally stable suitcase (6) is provided with securing elements (10) which are movable between retracted positions within the interior of the suitcase, to deployed positions which extend to the exterior of the suitcase, for engaging the receiving tracks.

a1

7. (New) The dimensionally stable suitcase (6) according to claim 6, further comprising actuation means (7, 8, 9) which are integrally formed in the suitcase.
